Subject: Comments on proposed cleanup steps at Olin

Dear Melanie,

Here are some comments I have on the cleanup plan:

- I think it is important to conduct further investigation to understand the impact of contaminant migration through bedrock fractures, especially since there does not seem to have prior actions involving removal of contaminants from fractures.
- I am wondering whether the 2012 pilot program included studies on how the act of extraction may impact how contaminants migrate in the surrounding area? The reason is that when the municipal wells were in operation they resulted in upward migration of contaminants.
- Since nitrosamines represent a class of chemicals, I think the treated water should be tested for species beyond the dimethyl and diphenyl species to reduce the likelihood of other nitrosamines being released into the environment.

Thank you.

Regards,
Haosheng
